                       improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, lighin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert polynucleotide that can be used in the recombinant DNA construct of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               762 CAACTGAAAACAGCCGAGCGATCTCCTCCCTCTCCCTCTCCGATCCATTCTCCAGCGC 821
                                                                                          The invention describes a recombinant DNA construct comprising a polymucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from 1900 yearent office at ftp.seqdata.uspto.gov/sequence.html?DocID:2004034888. The polymucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, lighin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of
                                                                                                                                                                                                                                                                                                                                photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert polymucleotide that can be used in the recombinant DNA construct of the

The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at trp.seqdata.uspto.gov/sequence.html?DocID:2004034888. The polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant colerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, increased resistance to plant disease, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one careas condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert property of the content. This sequence represents a plant full length insert of the
                                                                                                                                                                        New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens pests, for conferring increased resistance to plant disease, or for improving yield.
                                                                         Liu J, Zhou Y, Kovalic DK, Screen SE, Tabaska JE, Cao Y;

ö

New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for improving yield.

Claim 1; SEQ ID NO 12891; 15pp; English.

The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the sequence is uspto:gov/sequence.html?DocID:2004034888; The polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, hearbicides, extreme improving plant tolerance to cold, heat, drought, hearbicides, extreme improving plant tolerance to cold, heat of manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistence to plant disease, for moreasing the rate of homologous recombination in plants, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one arress condition or for modifying seed oil or pictein yield and/or content. This sequence represents a plant full length insert polynucleotide that can be used in the recombinant DNA construct of the nvention

Corn tassel-derived polynucleotide (cdps) SEQ ID NO:6065.

Corn, corn tassel-derived polynucleotide, cdps, hybrid breeding, CDPs inheritance, characteristic, growth, development; disease resistance; environmental adaptability; quality, yield; molecular marker; multigene trait; plant breeding; corn tassel; gene; ss.

Zea mays

US2001051335-A1

```
polymucleotide sequence (cdps) comprising a nucleic acid sequence selected from those given in ABL70627 to ABL76813. The cdps sequences encode corn tassel-derived polympetides (CDPs). The cdps sequences can be used for determining altered gene expression, to recover regulatory elements and to follow inheritance of desirable characteristics through hybrid breeding programs. (I) are also useful in the evaluation, and alteration of desired characteristics associated with growth and development, disease resistance, environmental adaptability quality and yield, and as molecular markers for studying inheritance of a tassel-specific profile of gene transcription, a transcript image, to clone regulatory elements for use in transformation vectors, to express a polypoptide, to identify, isolate or extend identical or related corn tassel nucleic acid sequences from DNA libraries, in nucleic acid
                                                                                                                                                                                                                                                                    Novel purified corn tassel-derived polynucleotide useful for determining altered gene expression, to recover regulatory elements and to follow inheritance of desirable characteristics through hybrid breeding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             hybridisation or amplification technologies, as query sequences to determine homology of known sequences, as probe for use in Southern Northern hybridisation, and to identify the presence of and/or to determine the degree of similarity between two (or more) nucleic aci

The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at try. seqdata.uspto.gov/sequence.html?DocID:2004034888. The polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, ignin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photogonyntheals or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content this sequence represents a plant full length insert of the
                                                                                                                                                                                                                                                                                                                                                             New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          recombinant DNA construct; physical array; plant breeding marker; cold tolerance; heat tolerance, drought tolerance; herbicide tolerextreme osmotic condition; pathogen tolerance; pest tolerance; growth rate; cell cycle pathway; disease resistance;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant calls by modification of the call cycle pathway. For conferring increased resistance to plant disease, for increasing the rate of homologous lighth or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of the increasing the rate of homologous recombination in plants, for increasing the rate of homologous recombinant or plant growth regulators, for increasing the rate of homologous recombinant or plant growth regulators, in improving yield by modification of the increasing the rate of homologous recombinants of the plants growth regulators, the improving yield by modification of the increasing the rate of homologous recombinants and the plants growth regulators, the improving yield by modification of the increasing the rate of homologous recombinants and the plant growth regulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polynucleotide that can be used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens pests, for conferring increased resistance to plant disease, or for improving yield.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gape

The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form trom the US patent office at ftp. seqdata.uspto.gov/sequence.html?DociD:2004034888. The polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for increased resistance to plant disease, for increasing the rate of homologous lightin or plant growth regulators, for increasing the rate of homologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    content. This sequence represents a plant full length insert polynucleotide that can be used in the recombinant DNA construct of the

The invention relates to transforming a plant cell with either a nucleic acid encoding a plant cuticular lipid biosynthetic protein, or an acid encoding a plant cuticular lipid genese nucleic acid sequence targetted to a plant cuticular lipid gene, and then generating a plant from the plant cell. The cuticular lipid genes that may be used in the invention are given in AAA57811.

A5784 and AAA57891. The cuticle consists of a meshwork (cutin) of cross-ceterified polymerised hydroxy-fatty acids embedded in a complex mixture of nonpolar lipids (the cuticular wax). The cuticle protects and strengthens the plants, prevents evaporation of internal fluids and filters by radiation. Mutations in the cuticular lipids genes affects the quantity and composition of cuticular lipids; in maize, 17 loci (the glossy (gl) genes) have been identified as being in involved in cuticular lipid biosynthesis or control. The method is useful for introducing a lipid biosynthesis or control. The method is useful for introducing a conton, safflower, peant, palm or sunflower plant and generating a plant from the plant cell The transformed plants have improved environmental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          bacterial or

This is the nucleotide sequence of the maize per5 root preferential cationic peroxidase gene, which encodes a 333-amino acid peroxidase cationic peroxidase conjugate the sequences a polypeptide (see AAW8783). Genomic clones comprising per5 sequences were isolated from a maize W22 genomic clones comprising per5 sequenced to per5 cDNA. Overlapping subfragments of the gene were sequenced to determine the complete 6550 by sequence of the per5 gene. Regulatory sequences derived from the per5 gene, including the promoter, introns and 3 untranslated region (3'UTR), are used in claimed recombinant gene cassettes for controlling expression of recombinant gene in selected tissue, especially the root, of transformed plants, particularly maize. The gene cassettes can be used for expression of heterologous genes such as those that confer tolerance to herbicides, insects or viruses, and genes that provide improved nutritional value or processing characteristics to the plant. Use of the per5 3'UTR sequences provides
sequence is specifically claimed in Claim 2"

New isolated regulatory sequences for transgenic plants - which are derived from the malze root preferential cationic peroxidase protein (per5) gene

Example 11; Page 108-112; 150pp; English

This is the nucleotide sequence of PerGUS, a plasmid containing 4 kb of the maize root preferential cationic peroxidase per5 gene comprising the per5 promoter, untranslated leader, and the first 5 codons of the coding region (1.e. nucleotides 1-4200 of the sequence given in AAV63717), as well as the GUS gene, and the nos 3' untranslated region (3'UTR). It does not include an intron in the untranslated region. The invention relates to new isolated regulatory sequences, especially promoter, intron and 3'UTR sequences, of the maize per5 gene. Claimed recombinant gene cassettes comprising per5 regulatory sequences are used to control expression of recombinant genes in selected tissue, especially the root, of transformed plants, particularly maize

The invention describes a recombinant DNA construct comprising a polynuclectide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the savilable in electronic form from the US patent office at the savilable of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, lignin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polynucleotide that can be used in the recombinant DNA construct of the

The invention relates to transforming a plant cell with either a nucleic acid encoding a plant cuticular lipid biosynthetic protein, or an antisense nucleic acid sequence targetted to a plant cuticular lipid gene, and then generating a plant from the plant cell. The cuticular lipid genes that may be used in the invention are given in AAA57811-A57884 and AAA57891. The cuticular centeristic polymerised hydroxy-fatry acids embedded in a complex mixture of nompolar lipids (the cuticular wax). The cuticle protects and strengthens the plants, prevents evaporation of internal fluids and filters UV radiation. Mutations in the cuticular lipid genes affects the clustic and composition of cuticular lipids; in maize, 17 loci (the glossy (gl) genes) have been identified as being in involved in cuticular lipid biosynthesis or control. The method is useful for introducing a nucleic acid into a cell preferably of maize, soybean, rapessed, canola, cotton, safflower, peanut, palm or sunflower plant and generating a plant from the plant cell. The transformed plants have improved environmental from the plant cell. The transformed plants have improved environmental from the plant cell. The transformed plants have improved environmental from the plant cell. The transformed plants have improved environmental crommental control.

This is the nucleotide sequence of the maize pers root preferential cationic peroxidase gens, which encodes a 33-amino acid peroxidase cationic peroxidase gens, which encodes a 33-amino acid peroxidase cationic polypeptide (see AAW87893). Genomic clones comprising pers sequences were isolated from a maize W12 genomic library using a probe based on isolated pers cont. Overlapping subfragments of the gene were sequenced to certain the complete 6550 bp sequence of the pers gene. Regulatory content to the complete 6550 bp sequence of the pers gene. Regulatory contents for controlling expression of recombinant gene cassettes for controlling expression of recombinant gene is specially the root, of transformed plants, particularly maize. The gene cassettes can be used for expression of heterologus genes such as those that confer tolerance to harbicides, insects or viruses, and genes that provide improved nutritional value or processing characteristics to the plant. Use of the pers 3'UTR sequences provides characteristics to the plant. Use of the pers 3'UTR sequences provides 3'UTR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

New isolated regulatory sequences for transgenic plants - which are derived from the maize root preferential cationic peroxidase protein per5) gene

Example 11; Page 108-112; 150pp; English

This is the nucleotide sequence of PerGUS, a plasmid containing 4 kb of the maize root preferential cationic peroxidase per5 gene comprising the per5 promoter, untranslated leader, and the first 5 codons of the coding region (i.e. nucleotides 1-4200 of the sequence given in AAV63717), as well as the GUS gene, and the nos 3' untranslated region (3'UTR). It does not include an intron in the untranslated region. The invention relates not include an intron in the untranslated region. The invention relates 3'UTR sequences, of the maize per5 gene claimed recombinant gene cassettes comprising per5 regulatory sequences are used to control expression of recombinant genes in selected tissue, especially the root, transformed plants, particularly maize

It currently consists of 31 contige. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 15 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       contig of 7711 bp in length

                                                                                                                                                                                                    * NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

This sequence will be replaced

by the finished sequence as soon as it is available and the accession number will be preserved.

the accession number will be preserved.

It currently consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as truns of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     All repeats were identified using RepeatMasker:
Smit, A.F.A. & Green, P. (1996-1997)

* NOTE: This is a 'working draft' sequence. It currently consists of 3 conties. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the conties are represented as * runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

It currently consists of a contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

On Jan 14, 2005 this sequence version replaced gi:49035040. All repeats were identified using RepeatMasker: Smir, A.F.A. & Green, P. (1996-1997) http://ftp.genom.http://ftp.genom.edu/RM/RepeatMasker.html
                                                                                                                                                                                                                                                                                                                                                                                                         NOTE: This is a 'working draft' sequence. It currently consists of 7 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /mol_type="genomic DNA"
